Writing pages

Pages are written in Markdown, like the rest of the website: everything Markdown extensions render can be printed.

Text and lists

Paragraphs flow from one page to the next, and lists keep their numbering:

1. Write the page in Markdown.
2. Build the website with `mkdocs build`.
3. Download the PDF document of the page.

Text can be **bold**, *italic*, `code`, or a link to another page, which points to that page in the combined document.

Footnotes

Footnotes are listed at the end of the page.[1]

Code

Code blocks are highlighted, and continue on the next page when they are long:

```
from pathlib import Path

def documents(site: Path) -> list[Path]:
    """The PDF documents of a built website."""

    return sorted(site.rglob("*.pdf"))

for document in documents(Path("site")):
    print(document)
```

Admonitions

Note

Admonitions are printed like on the website.

Collapsed blocks

Collapsed blocks are opened in documents, so that nothing is missing.

Tabs

Every tab is printed, with its label:

Material

The `material` theme has dedicated support.

Read the Docs

The `readthedocs` theme has dedicated support too.

Other themes

Other themes are supported on a best-effort basis.

---

1. Footnotes of different pages don't mix in the combined document. ↩
