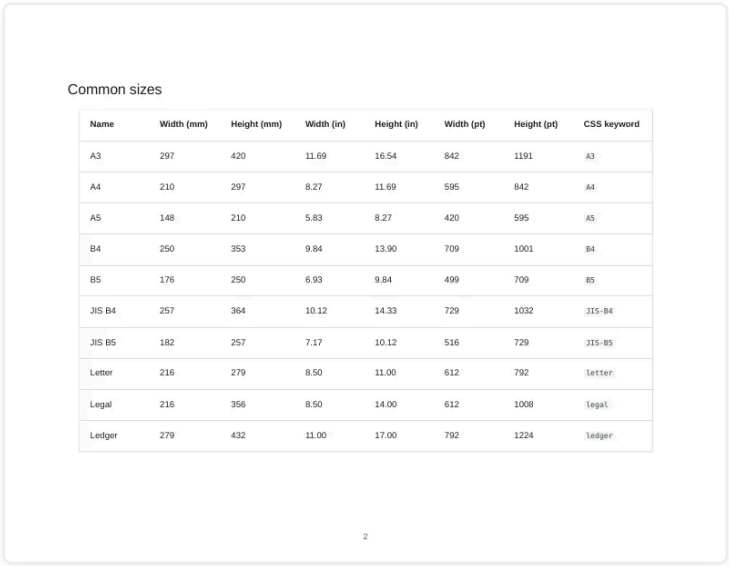
Paper size and landscape pages

Print documents on US Letter paper, and print wide tables on landscape pages.



reference/paper-sizes/index.pdf

`mkdocs.yml`

```yaml
plugins:
  - exporter:
      formats:
        pdf:
          stylesheets:
            - pdf.css
          footer:
            center: "{page}"
```

`pdf.css`

```css
@page {
  size: letter;
  margin: 2cm;
}

/* Elements of the `landscape` class are printed on landscape pages */
@page landscape {
  size: letter landscape;
}

.landscape {
  page: landscape;
}
```

A page

```
<div class="landscape" markdown>

## Common sizes

| Name | Width (mm) | Height (mm) | Width (in) | Height (in) | ... |
|---|---|---|---|---|---|
| A3 | 297 | 420 | 11.69 | 16.54 | ... |

</div>
```

- `size` accepts a keyword (`A4`, `A5`, `letter`, `legal`...), optionally followed by an orientation, or a width and a height (e.g. `size: 6in 9in`).
- `@page landscape` defines a named page, used by the elements of the `landscape` class: they start on a new landscape page, and the content following them on a new portrait page.
- The `md_in_html` extension renders the Markdown inside the `<div>`: any block can be given the class, here a section with its heading and its table.
- On the landscape page, the content is laid out with the width of that page, so the table fits.
