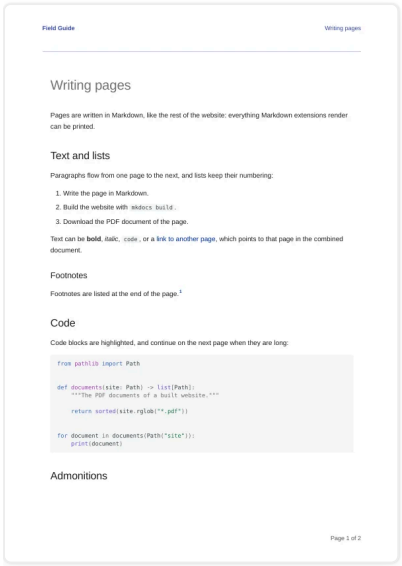
Page numbers

Number pages, and repeat the website's name and the current section at the top of each page.



guide/writing/index.pdf

`mkdocs.yml`

```yaml
plugins:
  - exporter:
      formats:
        pdf:
          stylesheets:
            - pdf.css
          header:
            left: "{site_name}"
            right: "{section}"
          footer:
            right: "Page {page} of {pages}"
```

`pdf.css`

```css
@page {
  size: A4;
  margin: 2.5cm 2cm;

  @top-left {
    color: #3949ab;
    font-weight: 600;
    border-bottom: 1px solid #c5cae9;
  }

  @top-right {
    color: #3949ab;
```

```
    border-bottom: 1px solid #c5cae9;
  }
}
```

- `header` and `footer` place text in the margins of every page, at the `left`, `center` or `right`. Their placeholders are replaced by the website's name (`{site_name}`), the heading the page starts with (`{section}`), the page number (`{page}`) and the number of pages (`{pages}`).
- The stylesheet sets the size of pages and their margins, leaving room for the header and the footer.
- Headers and footers are page margin boxes: the stylesheet styles them with `@top-left` and `@top-right` rules, which win over the plugin's own (each box needs a rule of its own).

To number pages without anything else, a footer is enough:

```yaml
plugins:
  - exporter:
      formats:
        pdf:
          footer:
            center: "{page} / {pages}"
```
